ANIMAL-FARM: An Extensible Framework for Algorithm Visualization Guido Rößling

This work presents a framework for algorithm animation that offers many unique features. This includes especially the highly flexible dynamicity of the framework regarding its assembly. The use of dynamic look-up data structures is extended to the administration of both components and their attributes. As a result, the framework allows the addition of individual components at run-time using dynamic loading as well as the removal of components or the introduction of new attributes. Other special features include the fully flexible bidirectional navigation control over the animation contents. The realization of the framework as a usable prototype underscores its flexibility and usability; the prototype adds yet more distinguishing features, such as the support for multiple generation and editing approaches and a built-in scripting language for modular animation components.
